3. Worksheet: Basic R

Brooke Peckenpaugh; Z620: Quantitative Biodiversity, Indiana University
15 January, 2019

OVERVIEW

This worksheet introduces some of the basic features of the R computing environment (http://www.r-project. org). It is designed to be used along side the **3. RStudio** handout in your binder. You will not be able to complete the exercises without the corresponding handout.

Directions:

- 1. Change "Student Name" on line 3 (above) with your name.
- 2. Complete as much of the worksheet as possible during class.
- 3. Use the handout as a guide; it contains a more complete description of data sets along with examples of proper scripting needed to carry out the exercises.
- 4. Answer questions in the worksheet. Space for your answers is provided in this document and is indicated by the ">" character. If you need a second paragraph be sure to start the first line with ">". You should notice that the answer is highlighted in green by RStudio.
- 5. Before you leave the classroom today, it is *imperative* that you **push** this file to your GitHub repo.
- 6. When you have completed the worksheet, **Knit** the text and code into a single PDF file by pressing the Knit button in the RStudio scripting panel. This will save the PDF output in your '3.RStudio' folder.
- 7. After Knitting, please submit the worksheet by making a **push** to your GitHub repo and then create a **pull request** via GitHub. Your pull request should include this file (**3.RStudio_Worksheet.Rmd**) with all code blocks filled out and questions answered) and the PDF output of Knitr (**3.RStudio_Worksheet.pdf**).

The completed exercise is due on Wednesday, January 16th, 2019 before 12:00 PM (noon).

1) HOW WE WILL BE USING R AND OTHER TOOLS

You are working in an RMarkdown (.Rmd) file. This allows you to integrate text and R code into a single document. There are two major features to this document: 1) Markdown formatted text and 2) "chunks" of R code. Anything in an R code chunk will be interpreted by R when you *Knit* the document.

When you are done, you will *knit* your document together. However, if there are errors in the R code contained in your Markdown document, you will not be able to knit a PDF file. If this happens, you will need to review your code, locate the source of the error(s), and make the appropriate changes. Even if you are able to knit without issue, you should review the knitted document for correctness and completeness before you submit the Worksheet.

2) SETTING YOUR WORKING DIRECTORY

In the R code chunk below, please provide the code to: 1) clear your R environment, 2) print your current working directory, and 3) set your working directory to your '3.RStudio' folder.

```
rm(list=ls())
getwd()
```

[1] "/Users/brooke/GitHub/QB2019_Peckenpaugh/2.Worksheets/3.RStudio"

3) USING R AS A CALCULATOR

To follow up on the pre-class exercises, please calculate the following in the R code chunk below. Feel free to reference the 1. Introduction to version control and computing tools handout.

- 1) the volume of a cube with length, $l_1 = 5$ (volume = l^3)
- 2) the area of a circle with radius, $r_1 = 2$ (area = $pi * r^2$).
- 3) the length of the opposite side of a right-triangle given that the angle, theta, = pi/4. (radians, a.k.a. 45°) and with hypotenuse length sqrt(2) (remember: sin(theta) = opposite/hypotenuse).
- 4) the log (base e) of your favorite number.

```
5^3
## [1] 125
pi*(2^2)
## [1] 12.56637
sin(pi/4)*sqrt(2)
## [1] 1
log(11)
## [1] 2.397895
```

4) WORKING WITH VECTORS

To follow up on the pre-class exercises, please perform the requested operations in the R-code chunks below.

Basic Features Of Vectors

In the R-code chunk below, do the following: 1) Create a vector \mathbf{x} consisting of any five numbers. 2) Create a new vector \mathbf{w} by multiplying \mathbf{x} by 14 (i.e., "scalar"). 3) Add \mathbf{x} and \mathbf{w} and divide by 15.

```
x \leftarrow c(1, 3, 14, 18, 22)

w \leftarrow 14*x

(x + w)/15
```

```
## [1] 1 3 14 18 22
```

Now, do the following: 1) Create another vector (k) that is the same length as w. 2) Multiply k by x. 3) Use the combine function to create one more vector, d that consists of any three elements from w and any four elements of k.

```
k <- c(2, 4, 5, 17, 30)
k*x
## [1] 2 12 70 306 660
d <- c(w[1:3],k[1:4])
```

Summary Statistics of Vectors

In the R-code chunk below, calculate the **summary statistics** (i.e., maximum, minimum, sum, mean, median, variance, standard deviation, and standard error of the mean) for the vector (v) provided.

```
v \leftarrow c(16.4, 16.0, 10.1, 16.8, 20.5, NA, 20.2, 13.1, 24.8, 20.2, 25.0, 20.5, 30.5, 31.4, 27.1)
v2 <- na.omit(v)</pre>
max(v2)
## [1] 31.4
min(v2)
## [1] 10.1
sum(v2)
## [1] 292.6
mean(v2)
## [1] 20.9
median(v2)
## [1] 20.35
var(v2)
## [1] 39.44
sd(v2)
## [1] 6.280127
sem <- function(x){</pre>
  sd(x)/sqrt(length(x))
}
sem(v2)
```

[1] 1.678435

5) WORKING WITH MATRICES

In the R-code chunk below, do the following: Using a mixture of Approach 1 and 2 from the **3. RStudio** handout, create a matrix with two columns and five rows. Both columns should consist of random numbers. Make the mean of the first column equal to 8 with a standard deviation of 2 and the mean of the second column equal to 25 with a standard deviation of 10.

```
a <- c(rnorm(5, mean = 8, sd = 2))
b <- c(rnorm(5, mean = 25, sd = 10))
c <- cbind(a,b)
dim(c)</pre>
```

[1] 5 2

Question 1: What does the rnorm function do? What do the arguments in this function specify? Remember to use help() or type ?rnorm.

Answer 1: The rnorm function generates random deviates from a normal distribution. Argument n specifies the number of observations, mean specifies a vector of means, and sd specifies a vector of standard deviations.

In the R code chunk below, do the following: 1) Load matrix.txt from the 3.RStudio data folder as matrix m. 2) Transpose this matrix. 3) Determine the dimensions of the transposed matrix.

```
m <- as.matrix(read.table("data/matrix.txt", sep = "\t", header = FALSE))
n <- t(m)
dim(n)</pre>
```

[1] 5 10

Question 2: What are the dimensions of the matrix you just transposed?

Answer 2: 5x10 (5 rows, 10 columns)

Indexing a Matrix

In the R code chunk below, do the following: 1) Index matrix m by selecting all but the third column. 2) Remove the last row of matrix m.

```
dim(m)
## [1] 10 5
o <- m[ ,c(1:2, 4:5)]
p <- m[1:9, ]</pre>
```

6) BASIC DATA VISUALIZATION AND STATISTICAL ANALYSIS

Load Zooplankton Data Set

In the R code chunk below, do the following: 1) Load the zooplankton data set from the **3.RStudio** data folder. 2) Display the structure of this data set.

```
meso <- read.table("data/zoop_nuts.txt", sep = "\t", header = TRUE)
str(meso)

## 'data.frame': 24 obs. of 8 variables:
## $ TANK: int 34 14 23 16 21 5 25 27 30 28 ...</pre>
```

```
## $ TANK: int 34 14 23 16 21 5 25 27 30 28 ...

## $ NUTS: Factor w/ 3 levels "H","L","M": 2 2 2 2 2 2 2 2 2 3 3 ...

## $ TP : num 20.3 25.6 14.2 39.1 20.1 ...

## $ TN : num 720 750 610 761 570 ...

## $ SRP : num 4.02 1.56 4.97 2.89 5.11 4.68 5 0.1 7.9 3.92 ...

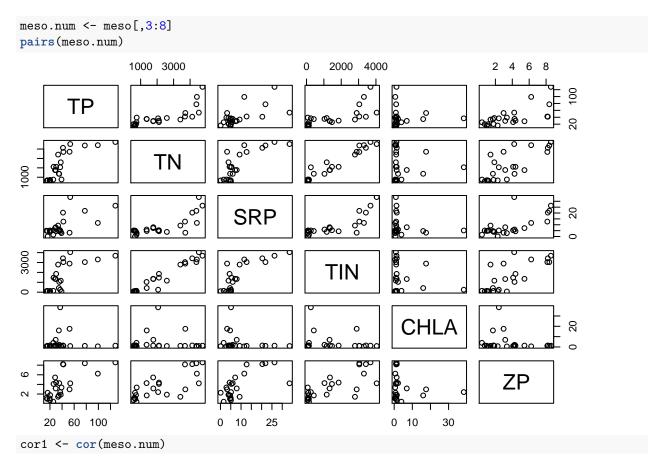

## $ TIN : num 131.6 141.1 107.7 71.3 80.4 ...

## $ CHLA: num 1.52 4 0.61 0.53 1.44 1.19 0.37 0.72 6.93 0.94 ...

## $ ZP : num 1.781 0.409 1.201 3.36 0.733 ...
```

Correlation

In the R-code chunk below, do the following: 1) Create a matrix with the numerical data in the meso dataframe. 2) Visualize the pairwise **bi-plots** of the six numerical variables. 3) Conduct a simple **Pearson's correlation** analysis.

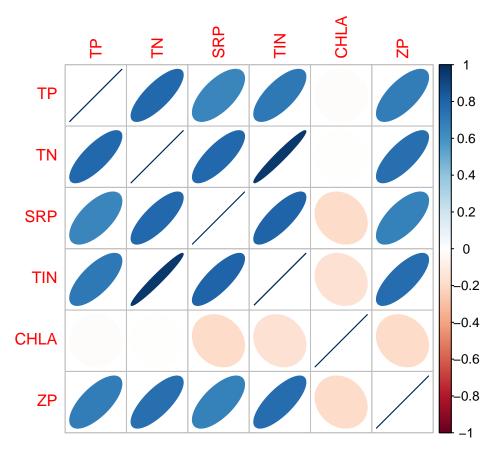

Question 3: Describe some of the general features based on the visualization and correlation analysis above?

Answer 3: Visually, it appears that some variables are quite correlated, while others are not at all—most notably in plots with CHLA. This seems to be verified by the correlation analysis, in which most variable pairs have high coefficients, but CHLA does not seem to correlate with anything.

In the R code chunk below, do the following: 1) Redo the correlation analysis using the corr.test() function in the psych package with the following options: method = "pearson", adjust = "BH". 2) Now, redo this correlation analysis using a non-parametric method. 3) Use the print command from the handout to see the results of each correlation analysis.

```
require("psych")
## Loading required package: psych
cor2 <- corr.test(meso.num, method = "pearson", adjust = "BH")</pre>
print(cor2, digts = 3)
## Call:corr.test(x = meso.num, method = "pearson", adjust = "BH")
## Correlation matrix

```

Question 4: Describe what you learned from corr.test. Specifically, are the results sensitive to whether you use parametric (i.e., Pearson's) or non-parametric methods? When should one use non-parametric methods instead of parametric methods? With the Pearson's method, is there evidence for false discovery rate due to multiple comparisons? Why is false discovery rate important?

Answer 4: The results seem fairly robust to using either parametric or non-parametric methods. I think parametric tests should be used ideally, if your data follow a statistical distribution. Non-parametric tests can be used when your data do not follow a distribution or have a small sample size. There is little evidence for false discovery rate due to multiple comparisons. False discovery rate is important because if you neglected to account for it, you might wrongly assume the statistical significance of your result.

Linear Regression

Residuals:

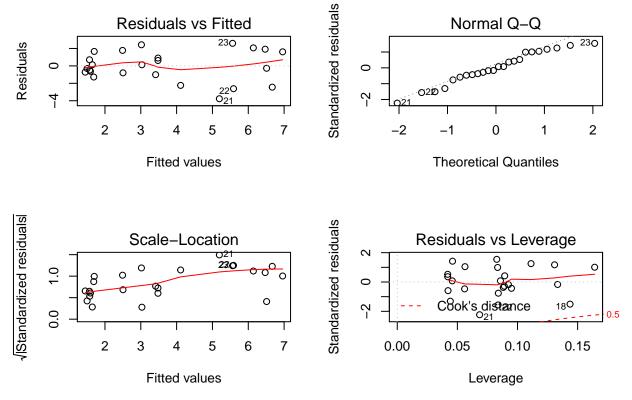

In the R code chunk below, do the following: 1) Conduct a linear regression analysis to test the relationship between total nitrogen (TN) and zooplankton biomass (ZP). 2) Examine the output of the regression analysis. 3) Produce a plot of this regression analysis including the following: categorically labeled points, the predicted regression line with 95% confidence intervals, and the appropriate axis labels.

```
fitreg <- lm(ZP ~ TN, data = meso)
summary(fitreg)

##
## Call:
## lm(formula = ZP ~ TN, data = meso)
##</pre>
```

```

                                                                                  5000
                                       Total Nitrogen (µg/L)
par(mfrow = c(2,2), mar = c(5.1, 4.1, 4.1, 2.1))
```

plot(fitreg)

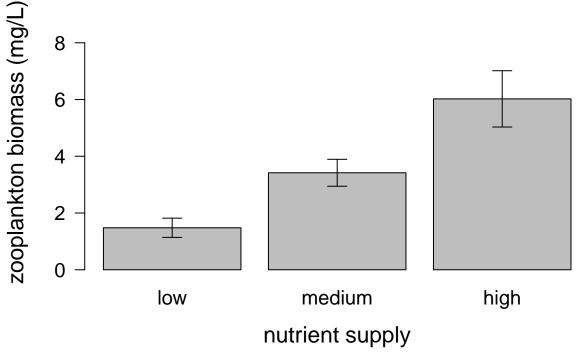

Question 5: Interpret the results from the regression model

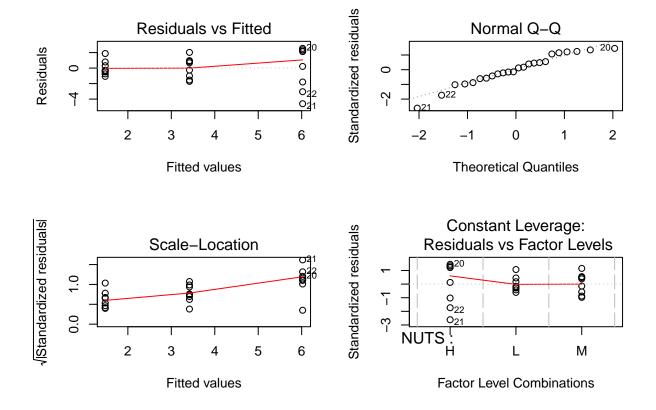

Answer 5: When total nitrogen increases by 1 ug/L, we expect zooplankton biomass to increase by 0.0013 mg/L on average. This result is statistically significant with a p-value < 0.0001.

Analysis of Variance (ANOVA)

Using the R code chunk below, do the following: 1) Order the nutrient treatments from low to high (see handout). 2) Produce a barplot to visualize zooplankton biomass in each nutrient treatment. 3) Include error bars (+/- 1 sem) on your plot and label the axes appropriately. 4) Use a one-way analysis of variance (ANOVA) to test the null hypothesis that zooplankton biomass is affected by the nutrient treatment.

```
fitanova <- aov(ZP ~ NUTS, data = meso)
summary(fitanova)

SYNTHESIS: SITE-BY-SPECIES MATRIX

In the R code chunk below, load the zoop.txt data set in your **3.RStudio** data folder. Create a site-by-species matrix (or dataframe) that does *not* include TANK or NUTS. The remaining columns of data refer to the biomass (μ g/L) of different zooplankton taxa:

- CAL = calanoid copepods
- DIAP = Diaphanasoma sp.
- CYL = cyclopoid copepods
- BOSM = Bosmina sp.
- SIMO = Simocephallus sp.
- CERI = Ceriodaphnia sp.
- NAUP = naupuli (immature copepod)
- DLUM = Daphnia lumholtzi
- CHYD = Chydorus sp.

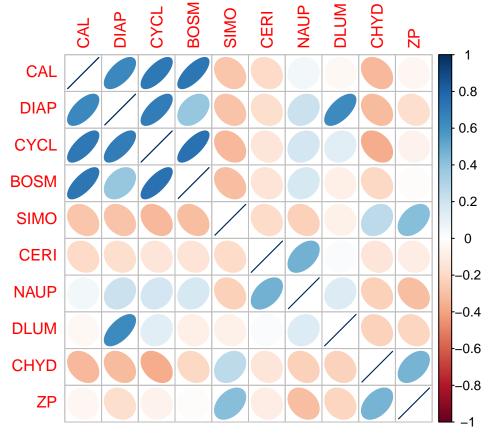

Question 6: With the visualization and statistical tools that we learned about in the **3. RStudio** handout, use the site-by-species matrix to assess whether and how different zooplankton taxa were responsible for the total biomass (ZP) response to nutrient enrichment. Describe what you learned below in the "Answer" section and include appropriate code in the R chunk.

```
zoops <- read.table("data/zoops.txt", sep = "\t", header = TRUE)
str(zoops)

## 'data.frame': 24 obs. of 11 variables:
## $ TANK: int 5 14 16 21 23 25 27 34 12 15 ...</pre>
```

```
## $ NUTS: Factor w/ 3 levels "H","L","M": 2 2 2 2 2 2 2 2 3 3 ...
## $ CAL : num 70.5 27.1 5.3 79.2 31.4 22.7 0 35.7 74.8 5.3 ...

```

Answer 6: Biomass for many of the taxa studied did not correlate with total zooplankton biomass. Simocephallus sp. and Chydorus sp. were positively correlated (when their biomass increased, so did the total biomass). This suggests that these taxa were responsible to some extent for the total biomass response to nutrient enrichment. However, this correlation is not particularly strong.

SUBMITTING YOUR WORKSHEET

Use Knitr to create a PDF of your completed **3.RStudio_Worksheet.Rmd** document, push the repo to GitHub, and create a pull request. Please make sure your updated repo include both the PDF and RMarkdown files.
